IMAGE PROCESSING TECHNIQUES – EXTENDED CLASS ACTIVITIES WORKSHEET

UG Level | Duration: 10 Minutes per Activity

Name: Aditya Chauhan

Reg No: RA2311003030068

Date: 09/09/2026

Activity 15: Corner & Interest Point Detection

1. Define Interest Point.

2. Name two corner detection algorithms.

3. Why are corners more stable than edges for tracking?

4. In which applications are interest points used?

Answer:

1. An interest point is a distinctive point in an image, such as a corner or junction, where the image intensity changes significantly in different directions.

2. Harris Corner Detection and FAST Corner Detection.

3. Corners are more stable than edges for tracking because they have significant intensity changes in multiple directions, making them easier to identify and match consistently between different frames.

4. Interest points are used in applications such as object tracking, image matching, image stitching, motion estimation, 3D reconstruction, and feature matching.
